From request to reviewed quote.

A local quotation demonstration using sample products, prices and customer events.

The workflow

Capture a known-format request, validate exact catalog details, prepare a draft, record approval, check follow-up eligibility and create one simulated handoff.

What the local checks show

Two sample cable rolls and three circuit breakers produce a USD 306.00 subtotal. Unknown codes, ambiguous quantities and unit mismatches are held without a total. The handoff requires recorded approval and acceptance; repeats are refused.

Engineering evidence

The source record includes 34 passing automated checks and local browser verification. These checks establish bounded software behavior, not measured staff savings. Ten n8n workflow exports are supplied; n8n import and runtime execution remain unverified.

Scope of this demonstration

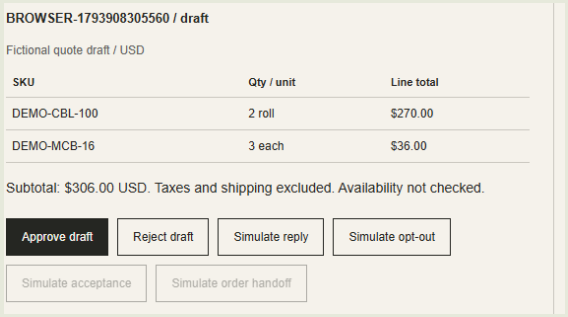

No customer messages, live inventory, tax or freight calculations, or ERP orders. Arbitrary email/PDF extraction, OCR, inferred matching and production reviewer authentication are outside this demo. A business system needs its own integration and review requirements.

Three execution checkpoints.

Actual captures from the local operator console. Sample data and scripted review events.

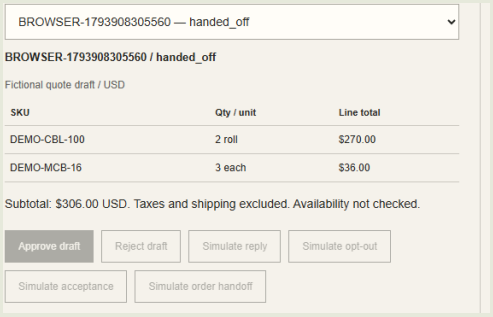

A draft awaits review

The valid request produces the sample USD 306.00 subtotal. Handoff stays disabled before approval and acceptance.

An exception is held

An unknown code and a non-integer quantity require review. No quote total is produced.

A single simulated handoff

After recorded approval and acceptance, the selected record reaches handed_off. No external order is created.

Source: supplied quote-draft, exception and simulated-handoff console captures, with recorded browser and test evidence. The original evidence images are preserved.
